This program allows you to keep track of all the system hardware components that can be configured separately from one another (like hard drive capacity, monitor resolution and so on). First and foremost, a summary of the hardware is displayed, with details such as OS, manufacturer and model. This is followed by reports on

---

the hard drive (where you can view the space allocation for your partitions), RAM configuration, motherboard details, network devices, optical drives (if any). You can also view processor parameters (such as model, number of cores and clock speed), as well as information on the sound and video devices that have been detected by the application. Computer Specs can perform

---

these actions separately for each section, therefore you cannot process the whole report. Both the print and export options are provided so that you can quickly save the results for further analysis. This program comes across as a user-oriented application that allows you to take a peek under the hood of your system in a comfortable manner. Reports are easy to understand, which

---

makes it fit for all audiences. This application can gather detailed information about the sound and video devices that have been detected by the application, including type (i.e. a sound card), speed, memory, HDDs and RAM. Computer Specs also allows you to view a summary of your motherboard's specifications, along with details of the memory chips and processing unit. Computer

Specs is a small, yet efficient application that serves to scan your computer and to fetch a detailed report of its hardware specifications. Although there's no shortage of such utilities on the software market, Computer Specs provides a simpler approach compared to similar software and gathers reports that are easier to interpret. Clean and intuitive interface  
Computer Specs is wrapped

inside a minimalistic and straightforward interface divided into several sections with suggestive titles that correspond to a specific piece of software (such as HDD, memory, motherboard and so on). This arrangement of functions allows it to provide an organized overview of the system resources.

Keymacro is an alternate keyboard macro recorder. It makes it easy to record and replay a combination of keystrokes in virtually any program. Just record the way you type, and review the list later. Keymacro can save a list of keystrokes to an arbitrary file. In addition to keyboard record and playback, Keymacro has the ability to convert a list

---

of text files into one large text file. This can be very handy for creating a large list of lines and concatenating them into a single document. Keymacro can also detect a macro when you copy and paste text or paste from an Internet page. You can choose whether to play a recorded macro or a selected text. It can also play and edit text one character at a time. Keymacro includes an automatic indent

---

function for re-indenting the selected text to be the same as the original formatting.

Keymacro has the ability to automatically save macros to a file and to write text to the clipboard. You can also copy the text in the clipboard to a text file or to another application. Keymacro records any number of keyboard commands at once and can playback those same commands

---

at once. Record macros from an instant message. Text is read in from a file in the clipboard, so macros can be based on any file that you are currently editing or copying. You can quickly create a macro from any word in the English language or any other language that supports Unicode. Just highlight any word, and click the Create a Macro icon to automatically record a macro containing that

---

word. One keyboard can be recorded multiple times. To do this, all you need to do is to re-record. Keymacro allows macros to be recorded, modified, and recalled from the command line. Allows users to quickly add text to a text box in their application or insert formatted text from a clipboard. Its initial version will be compatible with: Microsoft Word 2000, XP, 2003, 2007,

As the name suggests, Computer Specs helps you discover your computer's hardware specifications. The program presents a simplified interface packed with useful features such as identifying the manufacturer and model of your computer, checking all available storage spaces, as well as reporting the system's

---

configuration. Reporting tasks can be performed through the application's interface, as well as in a local text file or printed on a printer. At any rate, the application lets you carry out these actions separately for each section of the report.
