Postmarketing surveillance of a dibenzofuran derivative in oral contraceptives. Postmarketing surveillance of a new 1,3-dibenzoylcyclopentadecane derivative, 1,3-dibenzoylcyclopentadecanedioic acid (referred to as L-99), given as a 9-monthly contraceptive has been undertaken in 1167 women of whom 698 were distributed among various study groups. Of these women 533 were kept on treatment for 6 months and 163 had the treatment interrupted on account of adverse reactions. The total incidence of minor or major adverse reactions

in the safety study was 6.2% (7.6% of cycle-1 women and 3.6% of cycle-2 women). Six women discontinued treatment, of which one was due to obstetric complications and one was discontinued on account of systemic side effects (reported as headache and myalgia). No hypersensitivity reactions or dibenzoyl-ecodes were observed. There was no evidence of adrenal insufficiency. A dosing protocol is proposed to ensure the safe and adequate treatment of the growing community of oral contraceptive users. The fate of photoreceptor

- Runs even in True Speech - Large Files supported - Designed for Windows 2000/XP/2003/Vista/Win7 - No Win32 support - 64 Bit Protection/Unpacking - Dynamic Link Library Packer For more information about LARP64, visit: [Where To Get: region genotyping using isothermal real-time PCR: a quick assay for single-base mismatch detection. MHC genotyping is a useful tool for the diagnosis and follow-up of autoimmune diseases, such as rheumatoid arthritis, systemic sclerosis, and diabetes, and is used for forensic genetic analysis and paternity tests. A reliable genotyping method is critical, especially in patients lacking good-quality DNA samples. We have developed a high-performance isothermal real-time PCR assay, with three fluorescent probes targeting different sequences of the MHC class II DRB1 locus. A real-time PCR thermocycler enables the use of a single tube, the handling of large numbers of samples, and requires only standard laboratory equipment. Data can be acquired rapidly and the method is suitable for routine use in clinical laboratories. Serum anti-NF-kappaB1 p50 is an independent prognostic marker in stage I non-small cell lung](#)

cancer. The nuclear transcription factor kappa B (NF-kappaB) is an important regulator of cellular growth and survival. It also plays a central role in the pathogenesis of a variety of human diseases. However, the prognostic significance of NF-kappaB activation in non-small cell lung cancer (NSCLC) is still unknown. In this study, we investigated the prognostic significance of the expression of an NF-kappaB inhibitory protein in the progression and prognosis of NSCLC. We examined the expression of anti-NF-kappaB1 p50 in serum from 109 patients with NSCLC by enzyme-linked immunosorbent assay. In addition, survival time was analyzed according to various clinicopathologic factors, such as stage, histologic type, lymph node metastasis, and serum anti-NF-kappaB1 p50 level. Expression of the anti-NF-kappaB1 p50 in NSCLC patients had no correlation with clinical stage or histologic type. Expression of anti-
