Mgosoft XPS To PDF SDK

  As the XML Paper Specification (XPS) file format became more and more widespread, more and more enterprises and small and medium businesses began to employ it as a method for transmitting information and documents. The XML Paper Specification (XPS) format was developed to help users share information and documents among themselves and to exchange the information and documents with other platforms. In fact, XPS files are one of the most widely used formats for publishing content on the Internet. XPS is a subset of the more widespread PDF format. This fact makes it extremely easy for users to exchange files with other devices through the Internet. Unlike PDF files, XPS files can be edited directly and can be combined with each other and other files. In addition to the data contained in the document, information such as graphic elements, layout information and other digital assets can be included in the file. Users of XPS files can also easily share the document they are reading with other people who have the software necessary to view the information, without them having to download or install anything. In order to ensure that XPS files can be sent to any platform and be shared online, XPS files do not store images in the same way as PDF files. Instead, information regarding images is sent separately from the information regarding the file itself. Images can be included in the document as layers in the same way as they would be in a PowerPoint file. In fact, this format is even more flexible than the popular PDF format, which does not allow multiple layers. The popularity of the XPS file format is therefore largely due to the fact that users can easily edit the document they are reading, combine multiple files into a single document and share the document with others on the Internet. XPS files are still relatively new compared to PDF files, which have been used for years now. As they gain popularity, more and more applications are being developed in order to convert XPS files to PDFs and vice versa. In fact, one of the biggest challenges faced by developers is that users often send files to the companies who develop applications to convert them to PDF files, and the companies ask for an intermediate file to be sent to them before the conversion is complete. Users do not always want to wait for the software they are using to convert the file to finish, so they often choose to send the intermediate file they have received, and this is where problems start to occur. The reason for this is that intermediate files often do not have the exact same format as
