Robert Combe Robert Combe (1728–1792) was an English engineer and inventor. Combe's main contribution to the steam engine was the adoption of the rotative condensing cylinder, which is commonly used today. He also improved the design of the lathe, grinder, and rigger, invented the coal gasometer (for atmospheric pressure gas collection) and produced an improved version of the safe. In 1775, he patented a device for braking the wheels of carriages and carts by the use of a system of horizontal pulleys. Biography Combe was born at Eyebury, Essex, son of Richard Combe, "engineer", and Elizabeth Combe. Combe first saw a fire engine at the age of eleven. Robert read the writings of philosophers like Boethius and Seneca and was deeply impressed. When he was fourteen, his schoolmaster, James Bradley, was asked to teach him and made a drawing of his life from a comment by an anonymous correspondent of the Quarterly Review. This drawing was given to Combe when Bradley died, and it was according to Bradley's wishes that this piece of memorabilia should be converted into a biography. In 1743, he was admitted to the Worshipful Company of Wheelwrights in the City of London as a journeyman. In 1746, he was apprenticed to John Gray, and after Gray's retirement the following year, he was apprenticed to his successor, Samuel Carpenter. In 1748, he was a joint-master in the fire engines of Essex, and for a short period he was their inspector, and he also attended lectures given by John Smeaton. After a dispute with the Company regarding increasing his wages, he was expelled in 1756, but his father Richard Combe allowed him to return. He was allowed to become a master wheelwright in 1766. In 1754, he married Elizabeth Wyatt, and in 1758, the couple had a daughter, Elizabeth. Elizabeth and her husband had seven daughters and five sons. Robert Combe's work could have been limited to his engineering work, but the interjections of his wife served to temper his temperamental personality. Inventions Fires Combe's first invention was a fire engine, which he built in 1752. This was the first working model of a fire engine and its main feature was the invention of a bellows that

Q: If $x^2 + y^2 = 20$ then $xy\leq15$? If $x^2 + y^2 = 20$ then $xy\leq15$? A: You can solve it by subtracting two different cases: Case I: $x=y=0$ Case II: $x=15$, $y=10$ In the first one you have the only solution $x=y=0$, so you are done. In the second case you have two solutions $x=15$, $y=10$ and $x=10$, $y=15$. Both of them satisfies your inequality. Q: How to design a multi-level menu system? I'm designing a "skinny" multi-level menu where each level is a thumbnail image and users can click to move onto the next level. I have several issues with my design: There's too much empty space to the sides. They're not just empty space, they represent an a:visited menu item. There's no

flow for the user. Because I don't want users moving to the next level without having a reason to, I'm holding back on the mousemove event to prevent redirect. I don't want the user to think they're doing something wrong, I just want to make it clear that they can't jump to the next level without an animation. But since my user flow doesn't allow for movement, the only way to get to the next level is to use the menu, not the mouse. There's no focus on the current level, either. This is because if a user clicks on a thumbnail, the.thumbnail-menu should be shown. When that.thumbnail-menu is shown, clicking the thumbnail again should show the next.thumbnail-menu (sort of a repeating action). When they click to close the.thumbnail-menu, they should end up back where they were before clicking. // get the thumbnail-menu, if any, and place it at the end of the // element if ($thumbnail-menu.length) { $($target-element).append($thumbnail-menu); } this.$thumbnail-menu.on('mousedown.deactivatemouse', function(event) { // prevent redirect
