a special group of properties are defined to provide consistency in the way that audio and video properties are managed. the properties in this group share some of the same fields as the "audio" and "video" properties, but they also share some fields with the "analyzer" and "encoder" properties. as a result, the values of these properties will always be appropriate, even if the original audio or video file does not contain the same information. the dmo files are designed to be user-friendly and to facilitate interoperability. in order to keep the files small, metadata exchange does not try to include every possible property in the file. it attempts to include only those properties that are likely to be used. for example, metadata exchange does not include "text" property values in the file, but it does include the duration of the audio or video. this duration information can be used by an encoder in the creation of an srt file, for example. promedia capture can be used as a base for file-based recording from any acquisition source, including 3g, satellite, terrestrial, broadband, ip camera, and other sources. on any of these sources, promedia capture can be used to record single- or multi-channel programs. the gui includes a set of features that include: a set of controls for input and output that is designed for an intuitive workflow. stereoscopic and multi-camera recording. color-based metadata recording. a set of tools to assist in managing files. promedia capture is a platform for efficient time-based and event-based recording from virtually any acquisition source. with support for a range of widely-available digital media formats, promedia capture can be used for professional broadcast workflows, such as eng, ptz, and mobile eng, or for general purpose recording.
