
Hhmi Lizard Lab Answer Key

Start learning Module 2 of the virtual lizard lab. ... Answer: The same species of anole lizards developed independently on each of the islands. Due to these differences, some individuals could not interbreed and produce fertile offspring. When crossing, mutations developed in each population, which led to the death of individuals. This led to the need for mutation in new populations, which, in turn, led to the emergence of new mutations, etc. Question asked: As you know, lizards do not have a tail. Why did they lose it? Answer: Due to changes in the conditions for the formation of lizards, caused by a change in the conditions of existence.
