Looking for a piece of code to age a given PE's file? The "Age Calculator Activation Code" plugin's results are pretty simple: Unedited.txt file: age of the file being analyzed (in seconds) Ripped.txt file: the location of the code to age in seconds (and bytes!) Usage: First of all, run the plugin; you'll be prompted to select the file to be analyzed. After selecting it, you'll be presented with the following dialog box: In the first lines, you can decide to edit the original code to be analyzed, or to not edit it; in the second line, you can select one of the plugin's results format:Q: Allocating an array of an object by an object's constructor Let's say I have a class like this: struct Object { Object(int); }; And I want to allocate an array of Objects of type Object and do it in an one-liner like this: Object objects[] = new Object[3]; // This will not compile I am looking for a way to do that. If it is not possible, I would also like to know if there is a way to allocate an array of a class without the 'new' keyword. For example, what I would like to do is this: Object objects[] = {2, 3}; // This will compile A: You can do this by declaring the array as follows: Object* objects = new Object[3]; However, the code is quite ugly. It would be better to follow the array-of-pointers pattern, as in: Object **objects = new Object*[3]; //fill them with stuff delete [] objects; A: You cannot do what you want without new. You can allocate the array on the stack though, like this: Object * objects = new Object[3]; A: Object objects[] = new Object[3]; or Object **objects = new Object*[3]; or Object *objects = new Object[3]; and you can read it like this: Object *obj = objects[0]; you can also read it like this Object *obj; for(int i=0;i
