The Photoshop team has long had a complex history of fragmenting the development of its flagship product. In the '80s and '90s, they approached design of the product itself as a bottom-up process. Starting with an established design, they then did usability tests to identify problems, and once they got them fixed, they would add new features to bring the product to a new level. Photos were 15-by-20. People were at work, and it was more difficult and expensive to get those photos printed. For the past decade, design seemed to have been brought up to the status of a separate step in the process. With the launch of Photoshop CS 1, the team developed the product by starting with a new feature set and keeping it fixed. They spoke of the new "birds-eye" view for masking. They spoke of the new "grid"—and that's what it used. So I was intrigued when I had the opportunity to ask the Photoshop development team to explain how the product went from person to person after it was launched, and how that will work going forward. They made clear that CS wasn't conceived as a series of pileups of features; rather, it was thought of as one coherent product. The new view wasn't a cheap gimmick, and its success has shown that the team was on to something. The product is now considered one Microsoft Vista, or even Mac OS X Lion. A successor will be released in May 2016, and that suggests that everything in CS6 is committed to that one version, and that they have removed the scattershot approach that characterized the first decade of a storied software history.
