If you have upgraded to Adobe Photoshop CC 2018, you have your own (virtual) "light table." From the comfort of your couch, you can rearrange, edit, and duplicate or merely view any of the images that you have stored on your desktop system. With the light table, you may just save yourself a trip to the office. **If** you wanted to save a trip that is. For all I know, I could sit at the office with no time to go anywhere! Today, it is quite simple to send your favorite images to Lightroom or Photoshop via Lightroom's smart library library. I like to think of the Lightroom library as a place that is somewhat similar to the telephone book. The Lightroom library goes to your selected "Preview" section , where you can make a selection of images. As you might have expected, the illustrations sit within their own annotations , or, for those of you who use the term *Illustrator*, the illustrations sit within their own Ai panels, so the second step is, we think, quite logical. If you had previously selected your images, you can simply start with your modified or new **"Image Adjustments" panel** from your desk. If you had not selected your images, we can start with **"Adjustment panel"**. You can, of course, work with images in the "Preview" section, as well. I find the Ai panels way easier than the Illustrator panels of the past! **Above:** The "File" menu in the new Ai panels. If you do not see a "New" option, click that. It will then take you to the "New" template window, which will have the new template's name listed as an option. Above, the new template **AiFun** is listed. **Below:** The "File" menu in the new Illustrator panels.

At the time of this writing, you will be able to edit content directly on the web in the Safari Web browser on iOS, the Chrome web browser on iOS, and the newest versions of the Edge mobile browser. As these browsers become more popular, Photoshop will be able to work directly on these

web browsers as well. Instead of putting an `content-editable` attribute on objects in a web page, you can simply edit it directly on the canvas and your changes will be reflected when you refresh the page. If you've ever used Adobe Photoshop, you'll know that most of its functions are separated into separate layers. For example, if you're using the `content-editable` editors, you only want to edit the text and not the layers below it. The idea of bringing a reasonably similar web application to Photoshop was not something that Adobe actively wanted to do. Therefore, the solution that Adobe came up with was to come up with a new application called • Adjustment> Worth noting is the adjustment options you can choose such as Curves, Levels, Clarity, and Sharpen. These tools allow you to alter the colors, brightness, shadows, and darkroom tone to into a pleasant balance of adjusted colors. • Path> Several options are available here, including using Overlay / Float, Screen / Float, and Lasso / Float. All of these allow you to place an active graphic over another, float it over the top, or leave it on top. Normally, the glide tool is used for this purpose. e3d0a04c9c
